BritCore — project notes

A UK travel companion app. **Single self-contained file** (`index.html`): all CSS in one `<style>` block, all JS in one `<script>` block, no build step, no framework, no external dependencies at runtime. Keep it that way unless there's a strong reason to split it.

Visual identity

- Background `#FFF8EC` (cream), cards white, primary brand colour navy `#1D3557` (`--navy` / `--accent`), text `#1F2933` (`--ink`), muted text `#5B6B78` (`--mute`).
- Green (`--trim`, `#2ECC71`) is used **only** for "this is live/current right now" — the pulsing location dot, the active stage in the journey timeline. Nowhere else. Completed states, accents, and icons are navy, not green.
- Icons are hand-drawn inline SVG, outline style only (`stroke:currentColor; fill:none; stroke-width:1.6-1.8; stroke-linecap/linejoin:round`), 24x24 viewBox. No emoji anywhere in the UI.
- Logo is an embedded base64 PNG in the header (shield + compass + green dot).

Structure

- `<header>` (logo + "BritCore") → `<nav>` (floating pill, fixed bottom) → five `<section>` tabs, each `hidden` by default.
- Tab switching: `go(id)` hides all sections except the one matching `id`, toggles `aria-selected` on nav buttons with a matching `data-p`. No routing library — just attribute toggling.
- Tabs (bottom nav): **Today, Live, Travel, Discounts, Account**. Guide is *not* a nav tab — it's reachable only via buttons (`data-go="guide"`) from Today and Account.

What each tab does

- **Today**: hero card gives clothing advice from temperature/rain inputs (currently hidden defaults, not live weather — the Open-Meteo API call is written but doesn't work on claude.ai's sandbox; this is one reason for moving to real hosting). Below it, a card with "Scan boarding pass" / "Use my current location" buttons.

- **Live**: the journey tracker. Scanning a boarding pass (via the browser's `BarcodeDetector` API) parses a real IATA BCBP barcode for flight number/route; falls back to a manual entry form. Shows a 5-stage timeline: Your location → Check-in → Departure → Arrival → Hotel ETA (the last is an estimate, +60min transfer buffer, not real data). Ships with **mock demo data** that shows on first load if no real flight is saved (flagged `mock:true`, never persisted to `localStorage`) so the design is visible without scanning anything.
- **Travel**: full-screen map view (CSS gradient + SVG "topo lines", not a real map), floating search bar, an expandable bottom sheet with three transport options (train/cab/rideshare) and an affiliate-commission disclosure line.
- **Discounts**: 2-column grid of category tiles (dark navy fill, white icon+label) linking out to railcards/National Trust/English Heritage/etc.
- **Account**: links to Guide and "My places" (the old Find/rate/Ideas places browser, moved here from its own tab).

Working conventions from this build

- Every CSS/HTML edit gets checked for brace/tag balance; every JS edit gets syntax-checked (`new Function(js)`) **and** run against a stub DOM in Node before being called done — real bugs were caught this way (e.g. a missing `overflow-x` quietly clipping an animation). Keep doing this.
- Edits are done with precise find-and-replace on the one file, not by regenerating it — keeps changes targeted and reviewable.
- The user's steer so far has been: clean/navy over playful/purple, no emoji, sparing use of green, compact spacing, real working features over decorative ones (e.g. the barcode scanner actually parses real boarding passes).

Known gaps / likely next steps

- Live weather lookup: written, untested outside claude.ai's sandbox — worth revisiting once hosted.
- Hotel ETA is a flat assumption, not calculated from a real address or distance.

- Only one flight/connection can be tracked at a time — no multi-leg (flight + layover + connecting flight) data model yet, though the UI has a "grab and drag to add a connection" affordance already built for it.
